

JUNAID KHAN

khan.junaid.122399@gmail.com | +1 (913)-222-4198 | LinkedIn | GitHub

Professional Summary:

- Python Developer with 8+ years of experience designing, developing, testing, deploying, and maintaining enterprise web applications, backend services, RESTful APIs, and automation solutions across banking, healthcare, retail, and technology domains.
- Strong expertise in Python, Django, Flask, FastAPI, object-oriented programming, API development, data processing, and application integration.
- Experienced in developing responsive web applications using React, Angular, JavaScript, TypeScript, jQuery, AJAX, HTML5, and CSS3, with a strong understanding of frontend and backend integration.
- Hands-on experience with PostgreSQL, MySQL, SQL Server, MongoDB, Pandas, NumPy, AWS, Docker, CI/CD, Git, Linux, pytest, and API testing tools.
- Skilled in developing scalable applications, implementing business logic, optimizing data-processing workflows, integrating cloud services, automating repetitive processes, troubleshooting production issues, and delivering reliable solutions throughout the software development lifecycle in Agile/Scrum environments.

Technical Skills:

- **Programming:** Python, JavaScript, SQL, TypeScript.
- **Python Technologies:** Django, Flask, FastAPI, Django REST Framework, Pandas, NumPy, Requests, Pydantic.
- **Web Technologies:** React, Angular, jQuery, AJAX, Django Templates, HTML5, CSS3, JSON, XML, RESTful APIs.
- **Backend Development:** REST API Development, Web Services, API Integration, Microservices, Object-Oriented Programming, Data Processing, Data Validation, Business Logic Development.
- **Databases:** PostgreSQL, MySQL, SQL Server, SQLite, MongoDB, Redis.
- **Testing:** pytest, unit testing, Integration Testing, API Testing, Postman, Mocking, Test Automation.
- **Cloud & DevOps:** AWS, Amazon EC2, Amazon S3, AWS Lambda, CloudWatch, Docker, Kubernetes, Jenkins, GitHub, CI/CD, Git, GitHub, GitLab, Linux, VS Code.

Professional Experience:

Client: BMO U.S. — Chicago, IL

September 2024 – Present

Role: Python Developer

Project Description:

Developed a Python-based financial transaction processing application to automate transaction ingestion, validation, transformation, reconciliation, and reporting. Built RESTful APIs using FastAPI and developed interactive React and TypeScript interfaces for transaction submission, processing status, and results monitoring. Used Pandas for financial data processing and PostgreSQL for persistent transaction data. Implemented AWS-based application services, Docker containers, structured logging, exception handling, and pytest-based unit and integration testing.

Responsibilities:

- Developed responsive web interfaces using React, TypeScript, CSS, and modern UI components, integrating frontend workflows with Python-based REST services and financial applications.
- Built interactive transaction screens that allowed users to submit files, monitor processing status, review validation results, and retrieve financial transaction information.
- Implemented React components and asynchronous API communication to retrieve backend data, handle user interactions, and dynamically update application content.
- Developed reusable frontend components and client-side validation to improve usability, data accuracy, and consistency across financial application workflows.
- Designed and developed scalable backend applications using Python, FastAPI, and Django to support transaction processing, business logic, and application integrations.
- Developed Python Flask services for supporting lightweight backend applications, API integrations, request handling, and business-process workflows alongside FastAPI-based services.
- Developed RESTful APIs and Python services for transaction validation, data transformation, reconciliation, and communication with internal and external applications.
- Used Pandas and NumPy to process, transform, validate, and analyze large financial datasets while implementing reusable Python modules and business rules.
- Implemented API authentication, structured logging, exception handling, configuration management, and reusable Python utilities to improve application reliability.
- Developed and supported cloud-based Python applications using AWS services for application hosting, cloud storage, monitoring, and automated processing workloads.
- Configured Docker-based development environments and supported CI/CD workflows for building, testing, packaging, and promoting Python applications across environments.
- Created comprehensive unit and integration tests using PyTest to validate Python business logic, REST APIs, data-processing workflows, and error-handling scenarios.
- Used Postman and automated API testing to validate request/response behavior, troubleshoot integration issues, and verify REST endpoint functionality.
- Deployed Python applications and API services through CI/CD pipelines, troubleshooting deployment issues and supporting applications across development, QA, and production environments.

Client: LEGACY HEALTH — Portland

August 2022 – August 2024

Role: Python Developer

Project Description:

Developed a Python and Django-based healthcare data processing platform to ingest, validate, transform, and standardize data from multiple systems. Built Angular and TypeScript interfaces for data submission, validation results, and processing-status monitoring. Developed REST APIs to connect frontend applications with Python backend services and used Pandas for large-scale data transformation. Implemented PostgreSQL data storage, AWS cloud services, application logging, exception handling, and automated testing using PyTest.

Responsibilities:

- Developed healthcare web interfaces using Angular, TypeScript, CSS, and reusable UI components, integrating frontend workflows with Python REST APIs.
- Implemented Angular services and HTTP communication to retrieve healthcare information from backend Python services and dynamically present processing results.
- Created reusable Angular components, forms, and client-side validation functionality to improve data-entry

accuracy and application usability.

- Developed backend services using Python, Flask, FastAPI, and Django to process, validate, transform, and standardize data received from multiple systems.
 - Designed RESTful APIs and reusable Python modules for data ingestion, business-rule validation, transformation, reporting, and application integration.
 - Built and enhanced Flask-based REST services using Python, implementing route handling, request validation, JSON responses, exception handling, and integration with healthcare data-processing workflows.
 - Used Pandas and NumPy to process large datasets and implemented Python exception handling, logging, configuration management, and reusable utility modules.
 - Deployed Python applications and APIs in AWS environments and supported cloud resources used for application hosting, storage, monitoring, and automated processing.
 - Used Docker to containerize Python applications and supported CI/CD pipelines for automated application builds, testing, packaging, and environment deployments.
 - Developed unit and integration tests using PyTest to validate Python business logic, data-processing workflows, API endpoints, and integration scenarios.
 - Used Postman and automated API testing to verify REST services, troubleshoot request/response issues, and validate application functionality.
 - Supported application deployments across development, QA, and production environments, investigating configuration issues and resolving runtime problems.
-

Client: NORDSTROM — Seattle, WA

November 2020 – July 2022

Role: Python Developer

Project Description:

Developed a Python-based retail inventory application that automated inventory file processing, product validation, data transformation, reporting, and integration with external inventory services. Built web interfaces using Django Templates, jQuery, and AJAX to provide dynamic inventory information and reporting capabilities. Developed REST APIs using Flask and Django and used Pandas for inventory data processing and reconciliation. Implemented MySQL for data persistence, AWS for application hosting, Docker for containerization, and PyTest for automated testing.

Responsibilities:

- Developed retail web interfaces using jQuery, AJAX, CSS, and server-rendered Django templates, integrating product and inventory workflows with Python applications.
- Implemented AJAX-based functionality to retrieve inventory and product information from Python APIs and dynamically update web application screens without full-page refreshes.
- Developed reusable UI components and client-side validation for inventory management, product information, and reporting workflows.
- Developed Python backend services using Flask and Django to support inventory processing, product workflows, reporting, and application integrations.
- Built RESTful APIs and reusable Python modules for data extraction, transformation, validation, reporting, and communication with external retail services.
- Used Pandas and NumPy to process inventory datasets and implemented Python logging, exception handling, file processing, and automated business workflows.
- Supported AWS-based application environments and used Docker to package Python services for consistent development, testing, and deployment across environments.
- Created unit and integration tests using PyTest and validated REST API functionality using Postman, ensuring application changes met functional and integration requirements.
- Used Git for source-code management and participated in code reviews, defect resolution, Agile development

activities, and collaborative release processes.

- Deployed Python applications and automation services through CI/CD processes and supported Linux-based runtime environments for scheduled inventory-processing jobs.
-

Client: Sutherland Global Services – Mumbai

July 2018 – October 2020

Role: Python Developer

Project Description:

Designed and developed a reusable Python framework for building REST APIs, web applications, and backend automation workflows. Implemented modular Python components for authentication, configuration management, logging, validation, API integration, and business logic using Flask, FastAPI, and Django. Developed lightweight web interfaces using JavaScript and jQuery with JSON-based communication between frontend and backend services. Integrated PostgreSQL for application data, Docker for deployment, and pytest for unit and integration testing.

Responsibilities:

- Developed server-rendered web applications using Django Templates, jQuery, AJAX, CSS, and JSON-based communication with Python backend services.
- Implemented dynamic web functionality using jQuery and AJAX to retrieve application data and improve user interaction within business workflows.
- Developed Python applications using Django and Flask, implementing business logic, REST APIs, data processing, automation, and third-party service integrations.
- Created reusable Python modules and scripts for file processing, data validation, transformation, report generation, and recurring business operations.
- Used Pandas and NumPy for data manipulation and transformation while implementing logging, exception handling, and configurable application workflows.
- Supported cloud-hosted Python applications and used Docker-based environments to package applications and maintain consistent development and testing environments.
- Created unit and integration tests using pytest and used Postman to test REST APIs, validate responses, and troubleshoot backend integration issues.
- Managed source code using Git and supported application deployment to Linux-based environments, troubleshooting runtime issues and assisting with production releases.

Education:

Master's in Computer Science, University of Central Missouri, Warrensburg, Missouri

Bachelor's in Computer Science, JNTUH, Hyderabad, India
